The development process was pretty simple given that this is a small program. The only real differences that collaborative programming practices brought was that we tended to ask each other how to do something before going to google. I believe this would be more effective if each person specialized in different things. The main challenge that we faced was making sure we could both push to the Github repo, as one of us had difficulties at first. We also had to choose a programming language that we both knew and could program in.

Architecture diagram:

The game starts by running a test in a for loop to make sure that an odd number is always generated. In a more complex project we would probably put this into a separate file so it wouldn't have to run every time.

```
void isOddTest(int r) {
    assert(r % 2 == 1);
}

int main(void)
{
    int r;

    for (int i = 0; i < 500; i++) {
        r = randGen();
        isOddTest(r);
    }
}
```

After that we go into the main user input loop.

```
int input = -1;

printf("Enter your guess: ");
scanf("%d", &input);

while (input != r)
{
    printf("%d is wrong, guess again!\n", input);

    printf("Enter your guess: ");
    scanf("%d", &input);
}

return 0;
}
```
